The Codère-Durette Orbital Floor Implants
Designed to fit under the orbital floor periosteum, behind the orbital rim (to which they should be attached). For different volume defects present in the superior sulcus [anophthalmic sockets], they are the easiest to place. (PMMA) 3 volumes, both sides. Sold non sterile.

Symblepharon Rings
Ideal to avoid re-adhesion of symblepharons. (PMMA)
Round (Sold non sterile.)
21-412 [small, 20 mm]
21-414 [medium, 22 mm]
21-416 [large, 24 mm]

Suction Cups
For easy insertion and removal of prostheses, conformers, and ocular shields without handle. The synthetic latex free rubber suction cups are autoclavable. 23-012LF. A dozen.

Cox® II and II H*
Nonreflective front, to protect from the LASER.

Interested in laser shields and instruments? Ask for our LASERSECURE catalogue.

Autoclavable plastic shields, Jaeger lidplates and Desmarres
Bilateral Plastic not for laser.
Unilateral

Up to 50 cycles in the autoclave. All shields available in black or transparent yellow.

Our TOP SELLER, the black shields block all light and vision. Yellow allows seeing pupil. Best for general anaesthesia and caustrophobia. Bilateral model with suction cup is ideal for blepharoplasty. Model with bilateral handle can be used in either eye and they are easier to insert and remove. The handle may interfere with certain procedures. All shields are available in 4 sizes. Packaged as:
\* ONE bilateral ocular shield with one suction cup. Sold as a unit.
\* ONE bilateral ocular shield with handle. Sold as a unit.
\* TWO unilateral (one left and one right) with handle. Sold as a pair. Sold non sterile.

Order by phone, fax, or mail. We ship worldwide.

Durette® motility ocular implant.
•For enucleation, evisceration and secondary implantation.
•Easily sutured to a network of tunnels that allow tissue ingrowth.
•In two 20mm models with more or less details for coupling with ocular prostheses.
•Compared to rough porous implants, PMMA has a permanently smooth surface for a low exposure rate.

The Durette® ocular implant: a motility implant with tunnels for suturing and that allows tissue ingrowth (clear PMMA in two 20mm models).

The Durette is a simple alternative, one to take advantage of today’s best surgical techniques. It is made with well-tolerated time-tested PMMA. It is a smooth-surfaced ocular implant for a low exposure rate. All models have tunnels for suturing the muscles. The network of 20 interconnected tunnels allows new tissue to form and integrate with surrounding tissue and aims to prevent migration, forward displacement and tissue stretching. Being permanently smooth-surfaced, in comparison with rough porous implants, they should not tend to compromise the covering tissues. All have an off-center medial posterior elongation for added volume and better front positioning of details for coupling with ocular prostheses. In 2 models of 20mm, easy to suture with special needle HRT17 (GA-502N from Sharpont Angiotech, sold separately). For enucleation, evisceration and secondary implantation.

Each model has more or less anterior details for coupling with the custom impression-fitted ocular prosthesis. Whichever model is preferred will offer optimal motility.

Herrera clips for holding the implant steady during surgery and maintain proper orientation. Stainless steel. Autoclavable. Sold non sterile. Set of 4 clips for each quadrants. 12-020

Refer to price list for additional devices available. PMMA cannot be autoclaved. Silicone can be autoclaved. Currently no devices are sold sterile, except sutures.
